

# Refrigeration unit

PAS 10001

# Independent refrigeration unit

PAS10001

*This independent refrigeration unit has been designed and developed to meet standards on human milk cooling.*

*This equipment should be connected to a HSC pasteuriser PAS10000 model. It runs automatically when the pasteurisation holding time is over. It operates a full cooling cycle down to 4 °C to meet actual regulation on human milk treatment and preserve the inactivation of pathogens and avoid re-growth of bacterial flora inside pasteurised human milk.*

The pasteuriser PAS10000 model associated with the refrigeration unit becomes the PAS10001 model.

- **Integrated water reserve**
- **Cooling duration at 4 °C: less than one hour**
- **Full automatic operation**
- **Follow up of the cooling cycle on the touch screen interface**
- **Adjustable cooling temperature**
